TABLE OF CONTENTS

PROBLEM STATEMENT

01

INTRODUCTION

1 INTRODUCTION

Tawakkalna App was developed by the Saudi Data and Artificial Intelligence Authority (SDAIA) to assist the government in combating Covid-19. In total, Tawakkalna App offers 44 services to Saudi government ministries such as the Ministry of Health, Hajj, and Umra.

Through the use of Facial Recognition, this project intends to ensure the real identity of Tawakkalna users by checking if the picture matches the person's national ID. This is a security feature that can be used to recognize people's real identities in crowded areas such as Hajj and Umrah , where it is otherwise difficult to identify them.

02

DATA DESCRIPTION

DATA DESCRIPTION

This dataset contains 10 images of 40 distinct people with 400 images of their faces. Each image has the same background and size. These images will be our main method of reference throughout this project. From them, subsets will be created for Testing and Training.

03

ALGORITHM

ALGORITHM

This study aims to perform facial recognition using four different classification models to determine which one is the best to use. The data splitted into:

80%

Training

20%

Testing

10 layers
20 Batch size
45 Epochs

97 % Accuracy

92 % Validation Accuracy

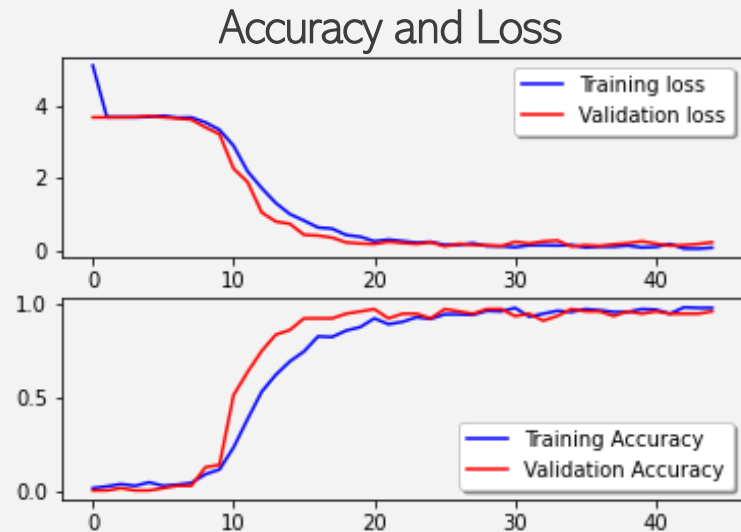

05

Result

Result

- Our best model it's CNN with 10 layers.

06

DEMO TEST

DEMO TEST

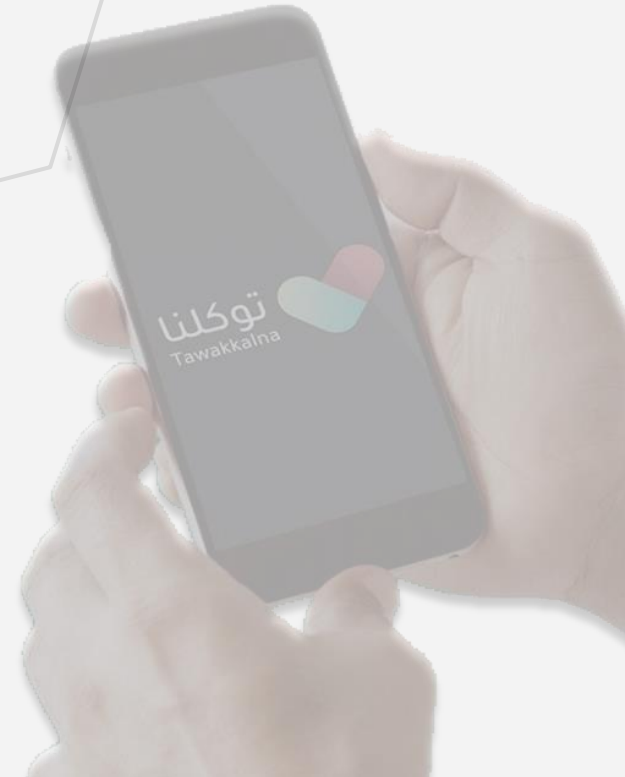

07 Future Work

Future Work

Iris Recognition biometric recognition systems which identify people based on their eyes and iris.

THANKS

For Your Listing ..

Do you have any questions ?
